

Public records. Traceable answers.

A documented internal research example, prepared for prospective customers. 4 October 2026.

The task

Prepare an identifiable, complete set of official public records for a bounded research exercise, so readers can inspect the underlying documents rather than rely on a summary alone.

What was completed

A source bundle containing **14 PDFs and one manifest** was accepted by the internal controller on 30 September 2026. The recorded checks found that every PDF matched its manifest hash, byte size and page count; the archive opened without a CRC error; and the required source groups, annexes and paired records were present. Quick text extraction was consistent with the manifest identity descriptions.

A small illustration: statements versus evidence

Observation	Where to check	What this supports
The publication is a response from Eric Pickles to the Lakanal House coroner.	GOV.UK publication page; PDF page 1.	Document identity and purpose.
The letter says research was commissioned to inform a future review of building regulations guidance.	PDF page 2, final section on Building Regulations.	What the letter states; not proof that the review was completed.

[Open the official publication page](#) | [Open the original three-page PDF](#). Page references use PDF page order. These public pointers were checked on 4 October 2026.

What a customer can commission

A scoped public-source research pack: original links, a source register, concise findings with page or timestamp references, and explicit gaps or uncertainty. Scope, acceptance criteria, price and delivery date are agreed before work begins. AI-assisted delivery is disclosed and agreed.

Limits and provenance

This is an internal example, not a paid-client case study or endorsement by any public body. File-integrity checks do not establish that every statement in a document is true. Acquisition and checking involved multiple stages and engines; no sole-founder delivery or comparative advantage is claimed. The illustration above identifies source support, not a legal or fire-safety conclusion.

Internal evidence: Grenfell / DCLG Frozen Source Bundle Controller Verification v0.1, 30 September 2026. The original source bundle and verification record are retained internally. Public documents remain attributed to their original publishers.
